

**Official****IN THE CLAIMS:**

1. (currently amended) A method in a communications system for routing a call, the method comprising:
- receiving a call;
  - identifying call routing information for the call;
  - responsive to identifying call routing information, determining whether a function to be performed by the subscriber has been selected for routing the call; and
  - responsive to a determination that a function to be performed by the subscriber has been selected for routing the call, routing the call using a sequence of destinations associated with the function to be performed by the subscriber.
2. (original) The method of claim 1 further comprising:
- responsive to identifying call routing information, determining whether a call routing schedule based on time has been selected for routing the call; and
  - responsive to a determination that a call routing schedule based on time is to be used, routing the call using a call routing schedule based on time.
3. (currently amended) The method of claim 1, further comprising:
- responsive to a determination that a function to be performed by the subscriber has been selected for routing the call, determining whether a time period for the function to be performed by the subscriber has expired;
  - responsive to a determination that a time period for the function to be performed by the subscriber has expired, routing the call; and
  - routing the call using a call routing schedule based on time instead of using the sequence of destinations associated with the function to be performed by the subscriber.
4. (original) The method of claim 1 further comprising:
- monitoring results from routing of the call; and
  - automatically modifying the call routing information based on the results to form modified call routing information, wherein subsequent calls are routed using the modified call routing information.

5. (currently amended) The method of claim 1, wherein the call is routed to a subscriber associated with the function to be performed by the subscriber.
6. (original) The method of claim 2 further comprising:  
monitoring results from routing of the call to the subscriber; and  
automatically modifying the call routing information based on the results to form modified call routing information, wherein subsequent calls are routed using the modified call routing information.
7. (original) A method in a communications system for call routing a call, the method comprising:  
receiving a call to a subscriber;  
routing the call to the subscriber using a sequence of destinations associated with the subscriber; and  
responsive to a success of routing the call to the subscriber to a destination within the sequence of destinations, automatically modifying the sequence of destinations used to call the subscriber, wherein the sequence of destinations is modified to favor destinations with successful call completions.
8. (original) The method of claim 7, wherein the sequence of destinations is modified to favor destinations with a selected level of call completions.
9. (original) The method of claim 7 further comprising:  
responsive to detecting initiation of a call by the subscriber from an origin absent from the sequence of destinations, modifying the sequence of destinations to include the origin as a destination within the sequence of destinations.
10. (original) The method of claim 8, wherein the origin is included as a destination within the sequence of destinations for a period of time.

- C
11. (original) The method of claim 8, wherein the calling line identifier is recorded to identify the origin from which the subscriber initiated the call.
12. (original) The method of claim 7, wherein the sequence of destinations are associated with a time slot.
13. (original) The method of claim 7, wherein the sequence of destinations are associated with a function.
14. (canceled)
15. (canceled)
- B  
Cont
16. (original) A method in a communications system for call routing a call, the method comprising:  
receiving a call to a subscriber;  
identifying a time of the call;  
routing the call to the first destination in an ordered set of destinations for the subscriber based on the time of the call;  
responsive to an absence of an answer of the call at the first destination, routing the call to a second destination in the ordered set of destinations;  
responsive to an absence of an answer of the call at the second destination, routing the call to a third destination in the ordered set of destinations; and  
responsive to an answer of the call at the third destination for a number of times, selecting the third alternate destination as the first alternate destination.
17. (original) The method of claim 16, wherein the second alternate destination is selected as the first alternate destination for a temporary period of time.
18. (original) The method of claim 17, wherein the temporary period of time is a day.

19. (original) The method of claim 16 further comprising:  
responsive to the third destination being answered over a period of time, setting  
the third destination as the second destination.
20. (original) The method of claim 16 further comprising:  
responsive to the second destination being answered over a period of time, setting the  
second destination as the first destination.
21. (original) A method in a graphical user interface for use in routing calls in a  
communications system, the method comprising the computer implemented steps of:  
displaying a set of icons, wherein each icon within the set of icons is associated  
with a function used to route calls to a party; and  
responsive to a selection of an icon within the set of icons, sending a message to  
the communications system to route calls to the party using a calling sequence associated  
with the function.
22. (original) The method of claim 21 further comprising:  
displaying a scheduling icon; and  
responsive to a selection of the scheduling icon, sending a message to the  
communications system to route calls to the party using a time based calling schedule.
23. (original) The method of claim 22, wherein the selection of an icon from the set  
of icons overrides any previous selection of an icon from the set of icons.
24. (original) The method of claim 23, wherein the selection of the icon overrides a  
previous selection of the scheduling icon.
25. (original) The method of claim 21, wherein the data processing system is a  
personal computer.

non-elected  
26. (original) The method of claim 21, wherein the data processing system is a mobile phone.

27. (original) The method of claim 21, wherein the data processing system is a personal digital assistant.

28. (currently amended) A switch comprising:

an input for receiving a call for a party;

signaling interface for sending a request to a database for call routing information, wherein call routing information from the database includes a calling sequence for a function associated with and to be performed by the subscriber the party in response to the subscriber party previously selecting the function to be performed by the subscriber; and

a switch fabric, wherein the call is routed from the input through the switch fabric to an output to a destination returned by the database using the calling sequence for the function to be performed by the subscriber.

29. (original) The switch of claim 28, wherein the request sent from the signaling interface to the database is sent to a service control point, which provides an interface to the database.

30. (original) A service control point comprising:

an input/output interface, wherein request for routing information is received from a requestor at the input/output interface and routing information returned to the requestor;

a database containing a plurality of calling sequences for subscribers; and

a processing unit connected to the input/output interface and the database, wherein the processing unit has a plurality of modes of operation including:

a first mode of operation in which the processing unit monitors for requests for routing information;

a second mode of operation, responsive to receiving a request, in which the processing unit identifies routing information for the call;

C

a third mode of operation, responsive to identifying routing information for the call, in which the processing unit determines whether a function has been selected for routing the call;

a fourth mode of operation, responsive to a determination that a function has been selected for routing the call, in which the processing unit sends routing information for the call using a sequence of destinations associated with the function; and

a fifth mode of operation, responsive to an absence of a determination that a function has been selected for routing the call, in which the processing unit sends routing information for the call using a call routing schedule based on time.

Cont

31. (currently amended) A communications system for routing a call, the communications system comprising:

receiving means for receiving a call;

identifying means for identifying call routing information for the call;

determining means, responsive to identifying call routing information, for determining whether a function to be performed by the subscriber has been selected for routing the call; and

routing means, responsive to a determination that a function to be performed by the subscriber has been selected for routing the call, for routing the call using a sequence of destinations associated with the function to be performed by the subscriber.

32. (original) The communications system of claim 31 further comprising:

determining means, responsive to identifying call routing information, for determining whether a call routing schedule based on time has been selected for routing the call; and

routing means, responsive to a determination that a call routing schedule based on time is to be used, for routing the call using a call routing schedule based on time.

33. (currently amended) The communications system of claim 31, further comprising:

C  
~~determining means, responsive to a determination that a function to be performed by the subscriber has been selected for routing the call, for determining whether a time period for the function to be performed by the subscriber has expired;~~

~~first routing means, responsive to a determination that a time period for the function to be performed by the subscriber has expired, for routing the call; and~~

~~second routing means for routing the call using a call routing schedule based on time instead of using the sequence of destinations associated with the function to be performed by the subscriber.~~

B  
Cont  
34. (original) The communications system of claim 31 further comprising:

~~first monitoring means for monitoring results from routing of the call; and~~

~~second modifying means for automatically modifying the call routing information based on the results to form modified call routing information, wherein subsequent calls are routed using the modified call routing information.~~

35. (currently amended) The communications system of claim 31, wherein the call is routed to a subscriber associated with the function to be performed by the subscriber.

36. (original) The communications system of claim 32 further comprising:

~~monitoring means for monitoring results from routing of the call to the subscriber;~~

~~and~~

~~modifying means for automatically modifying the call routing information based on the results to form modified call routing information, wherein subsequent calls are routed using the modified call routing information.~~

37. (original) A communications system for call routing a call, the communications system comprising:

~~receiving means for receiving a call to a subscriber;~~

~~routing means for routing the call to the subscriber using call a sequence of destinations associated with the subscriber; and~~

modifying means, responsive to a success of routing the call to the subscriber to a destination within the sequence of destinations, for automatically modifying the sequence of destinations used to call the subscriber, wherein the sequence of destinations is modified to favor destinations with successful call completions.

38. (original) The communications system of claim 37 further comprising:

modifying means, responsive to detecting initiation of a call by the subscriber from an origin absent from the sequence of destinations, for modifying the sequence of destinations to include the origin as a destination within the sequence of destinations.

39. (original) The communications system of claim 38, wherein the origin is included as a destination within the sequence of destinations for a period of time.

40. (original) The communications system of claim 38, wherein the calling line identifier is recorded to identify the origin from which the subscriber initiated the call.

41. (original) The communications system of claim 37, wherein the sequence of destinations are associated with a time slot.

42. (original) The communications system of claim 37, wherein the sequence of destinations are associated with a function.

43. (original) A communications system for call routing a call, the communications system comprising:

receiving means for receiving a call to a subscriber;

routing means for routing the call using call routing information associated with the subscriber;

monitoring means for monitoring results from routing of the call to the subscriber;

and

C  
modifying means for automatically modifying the call routing information based on the results to form modified call routing information, wherein subsequent calls are routed using the modified call routing information. in Harlow?

44. (original) The communications system of claim 43, wherein the means of routing the call comprises:

first routing means for routing the call to a main destination; and  
second routing means, responsive to an absence of an answer at the main destination, for routing the call to an alternate destination. *before main destination*

B  
45. (original) A communications system for call routing a call, the communications system comprising:

*Cont*  
receiving means for receiving a call to a subscriber;  
identifying means for identifying a time of the call; in Harlow??  
first routing means for routing the call to the first destination in an ordered set of destinations for the subscriber based on the time of the call;

second routing means, responsive to an absence of an answer of the call at the first destination, for routing the call to a second destination in the ordered set of destinations;

responsive to an absence of an answer of the call at the second destination, routing the call to a third destination in the ordered set of destinations;

responsive to an answer of the call at the third destination for a number of times, selecting the third alternate destination as the first alternate destination.

46. (original) The communications system of claim 45, wherein the second alternate destination is selected as the first alternate destination for a temporary period of time.

47. (original) The communications system of claim 46, wherein the temporary period of time is a day.

48. (original) The communications system of claim 45 further comprising:

C  
setting means, responsive to the third destination being answered over a period of time, for setting the third destination as the second destination.

49. (original) The communications system of claim 45 further comprising:  
setting means, responsive to the second destination being answered over a period of time, for setting the second destination as the first destination.

B  
Cont  
50. (original) A in a graphical user interface for use in routing calls in communications system, the communications system comprising:  
displaying means for displaying a set of icons, wherein each icon within the set of icons is associated with a function used to route calls to a party; and  
sending means, responsive to a selection of an icon within the set of icons, for sending a message to the communications system to route calls to the party using a calling sequence associated with the function.

51. (original) The graphical user interface of claim 50 further comprising:  
displaying means for displaying a scheduling icon; and  
sending means, responsive to a selection of the scheduling icon, for sending a message to the communications system to route calls to the party using a time based calling schedule.

non-elected claims  
52. (original) The graphical user interface of claim 51, wherein the selection of an icon from the set of icons overrides any previous selection of an icon from the set of icons.

53. (original) The graphical user interface of claim 52, wherein the selection of the icon overrides a previous selection of the scheduling icon.

54. (original) The graphical user interface of claim 50, wherein the data processing system is a personal computer.

*non-elected claims*

55. (original) The graphical user interface of claim 50, wherein the data processing system is a mobile phone.

56. (original) The graphical user interface of claim 50, wherein the data processing system is a personal digital assistant.

*C*

57. (currently amended) A computer program product in a computer readable medium for routing a call, the computer program product comprising:

- first instructions for receiving a call;
- second instructions for identifying call routing information for the call;
- third instructions, responsive to identifying call routing information, for determining whether a function to be performed by the subscriber has been selected for routing the call; and
- fourth instructions, responsive to a determination that a function to be performed by the subscriber has been selected for routing the call, for routing the call using a sequence of destinations associated with the function to be performed by the subscriber.

*B*  
*Cont*

58. (original) A computer program product in a computer readable medium for call routing a call, the computer program product comprising:

- first instructions for receiving a call to a subscriber;
- second instructions for routing the call to the subscriber using call a sequence of destinations associated with the subscriber; and
- third instructions, responsive to a success of routing the call to the subscriber to a destination within the sequence of destinations, for automatically modifying the sequence of destinations used to call the subscriber, wherein the sequence of destinations is modified to favor destinations with successful call completions.

*in Harlow or Feladane*  
*corresponds to claim 43*

59. (original) A computer program product in a computer readable medium for call routing a call, the computer program product comprising:

- first instructions for receiving a call to a subscriber;
- second instructions for identifying a time of the call;

*C*

third instructions for routing the call to the first destination in an ordered set of destinations for the subscriber based on the time of the call;

fourth instructions, responsive to an absence of an answer of the call at the first destination, for routing the call to a second destination in the ordered set of destinations;

fifth instructions, responsive to an absence of an answer of the call at the second destination, for routing the call to a third destination in the ordered set of destinations;

sixth instructions, responsive to an answer of the call at the third destination for a number of times, for selecting the third alternate destination as the first alternate destination.

*in Harlow ??*
